Projects

A comparison of shared encoders for multimodal emotion recognition [Multimodal ML][Slides | Report | Code]

- Developed unimodal audio and vision, and multimodal emotion recognition pipelines by employing various classes of shared encoders – 2D CNNs (`ResNet18`, `GoogLeNet`, `VGG16`), 3D CNNs (`Simple3D CNN`, `I3D`), Transformers (`ViT`, `VideoMAE`).
- Tested our pipelines on a full-scale version of CREMA-D dataset. Presented a principled comparison of the performance of different pipelines and encoders, identified the achievements and shortcomings of these architectures, and discussed the implications.

Leveraging static analysis for evaluating code-generation models [NLP][Slides | Report | Code]

- Developed a pipeline that integrates static errors generated by linters (`cppcheck`, `flake8`) as feedback to improve the baseline code generation model (`CodeLlama`), and fine-tuned the model using DPO to enhance its ability to directly generate code with fewer errors.
- Demonstrated the effectiveness of both strategies in reducing frequency of static errors in generated code.

Implemented `Procs`, `VFS`, and `VM` kernel modules of Weenix OS [OS][CS 402, USC]
