PROJECTS

A comparison of shared encoders for multimodal emotion recognition [Multimodal ML][[Slides](#) | [Report](#) | [Code](#)]

- Developed unimodal audio and vision, and multimodal emotion recognition pipelines by employing various classes of shared encoders – 2D CNNs (ResNet18, GoogLeNet, VGG16), 3D CNNs (Simple3D CNN, I3D), Transformers (ViT, VideoMAE).
- Tested our pipelines on a full-scale version of CREMA-D dataset. Presented a principled comparison of the performance of different pipelines and encoders, identified the achievements and shortcomings of these architectures, and discussed the implications.

Leveraging static analysis for evaluating code-generation models [NLP][[Slides](#) | [Report](#) | [Code](#)]

- Developed a pipeline that integrates static errors generated by linters (cppcheck, flake8) as feedback to improve the baseline code generation model (CodeLlama), and fine-tuned the model using DPO to enhance its ability to directly generate code with fewer errors.
- Demonstrated the effectiveness of both strategies in reducing frequency of static errors in generated code.
